

Skycatch FullStack Challenge

The challenge consist in add a sidebar to the existing LiveMap app. The sidebar will contain useful information such as Location Name, Open/Close hours and the current state of the location (is open / closed).

1. I read about the technologies in which the challenge will be solved.
2. Make a TODO of what I need to accomplish the task.
3. Draw a UI of how the app will look when I finish.
4. Developed the sidebar in plain css/js to make sure that was what I want.
5. Transpile my css/js into React an I encounter a problem. That problem was related of my constant use of Vuejs, I use “`{{ }}`” instead “`{ }`”.
6. I wrote a pseudocode of how the “locationAvalability” should work.
7. I realize that I cannot use minutes as a comparison value, because I had a problem obtaining minutes with “close_time”.
8. I remember two functions of momentjs I read before (isAfter/isBefore), and reading again I find “isBetween” and I decided to use it.
9. I realize that the time format doesn’t looks good and I decided to build a function that make time looks better.
10. I found an issue when you edit 2 times a location (the time doesn’t work again).
11. I found an issue when adding another location, it tooks the array content and adds the initial array + the new.
12. I try to fix the bugs above but I failed.
13. Pushed my work.
14. Forgot to add the documentation file.
